“What Size Tank do I Need for a Betta Fish?”

A betta fish tank should be a one gallon or larger to support your pet nicely. There are a number of things to look at when deciding on the size of the tank. You have to consider how many plants and decorations you are adding to it, how often you are performing partial water changes and the number of daily feedings. Betta fish have certain needs such as a constant room temperature between 71 and 84 degrees that does not regularly have large fluctuations. Keeping the aquarium water clean and water parameters healthy, by faithfully performing a 25% water change every 2 to 3 weeks and not overfeeding is as important. When feeding it is best to feed your pet small amounts of pelleted food a couple times a day, emphasizing again small amounts. Pet owners sometimes tend to overfeed and unfortunately to the detriment of their pet. Often people think just because they have a large tank they are not required to perform necessary monthly maintenance, so untrue.

Monitor your water chemistry weekly, check the temperature of the tank, perform scheduled maintenance, do not overfeed and observe your fish daily. Be responsible and you will have many years of enjoyment with your pet.

Hardy Fish for Beginners

Zebra Danio

The Zebra Danio is a highly active swimmer, especially when kept in small schools. Hardy and compatible with the majority of freshwater fish. Ideal for beginners.

Care Level: Beginners and up

Size: Up to 2 inches

Tank Region: Middle to top levels

Gender: Males have yellow in between the black stripes while females are sometimes larger.

Breeding: Egg layers

Origin: India

Active Community Fish

Should you rinse your gravel before adding it to the aquarium?

Yes, it's important to wash the gravel to remove dust and other debris that could cloud your fish tank water. Remove the gravel from the bag and place it in a clean bucket or in a spaghetti strainer or colander. Run water over the gravel several times, stirring with your hand until the water runs clear. Be sure to use a tap water conditioner before adding the gravel to the tank in order to remove any chemicals such as chlorine that can be harmful to your fish.

Never use soap or detergents to clean the gravel as they can be harmful to your fish.
